# Datablad "Jord identifiering"

## Struktur

Är jorden...

**Coarse (grainy):** resembles crumbs of cookies and is usually less than 5 mm in diameter. Is often found in horizons near the surface where roots grow

**Blocky (lumpy):** Irregular blocks, usually 15-50 mm in diameter.

**Prismatic:** Vertical soil columns (clearly visible in the horizon), which can be a several centimeters long. Usually found in lower horizons.

**Column-shaped:** Vertical columns with a white rounded "cap" at the top. To be found in soils in arid climate.

**Plate-like:** Thin, flat, horizontal soil sheets. Found in compacted soils.

Sometimes, soil samples do not have a visible structure. These are divided into the following two types:

**Single-grained:** The soil is broken up into individual particles that do not adhere to each other. The sample therefore always has a loose consistency. Is usually found in sandy soils.

**Solid (compact):** The soil has no visible structure, is almost impossible to break up and shows itself in large chunks.

Är jorden...

### Konsistens

Är jorden ...

**1. Loose:** It is difficult to take out a crumb and the structure falls apart before you start to work. Note: Single grain soils always have a loose consistency.

**2. Crumbly:** The soil crumb disintegrates even at low pressure.

**3. Firm:** The crumb only disintegrates under pressure, so the crumb leaves an imprint in your fingers.

**4. Very firm:** the crumb cannot be crushed with the fingers, you need a hammer for this.
